A radio wave directed at an angle into the sky can be reflected back to Earth beyond the horizon by these layers, allowing long distance radio transmission. The F2 layer is the most important ionospheric layer for long-distance, multiple-hop HF propagation, though F1, E, and D-layers also play significant roles.

Propagating Wave. Propagating waves are single-mode tone-burst signals that can be described by a simple function,  $f(t - \alpha \rightarrow \cdot x \rightarrow)$ , in which the space-time relationship  $t - \alpha \rightarrow \cdot x \rightarrow$  applies, with  $\alpha \rightarrow = k \rightarrow / \omega$ .
