Solution Operating System Concepts By Galvin, Silberschatz Solved By Abhishek Pharkya Part 1: Theory What is the primary difference between a kernel-level context switch between processes (address spaces) and a user-level context switch? The primary difference is that kernel-level context switches involve execution of OS code. As such it requires crossing the boundary between user- and kernel-land two times.

Answer:Clustered systems are typically constructed by combining multiple computers into a single system to perform a computational task distributed across the cluster. Multiprocessor systems on the other hand could be a single physical entity comprising of multiple CPUs. A clustered system is less tightly coupled than a multiprocessor system.
