The only work to date to collect data gathered during the American and Soviet missions in an accessible and complete reference of current scientific and technical information about the Moon.

Multi-ring basins are large impact craters formed in the early history of planets. They critically affect the evolution of the planets and their satellites. The Moon offers an exceptional chance to study these phenomena and this book provides a

comprehensive geological study using data from lunar landings and remote sensing of the Moon. The author covers the formation and development of basins and considers their chemistry and mineralogy. He studies their effects on the volcanic, tectonic and geological evolution of the planet, including the catastrophic consequence on the planetary climate and evolution of life. This study is lavishly illustrated with many spectacular, highly-detailed photographs and diagrams.

The merging of metasurface and holography brings about unprecedented opportunities for versatile manipulation of light in terms of both far-field wavefront and near-field profile. In this book, a brief evolving history from surface plasmon

polariton holography to metamaterial holography and finally to metasurface holography is introduced at first. Basic physical mechanisms that govern the phase modulation rules behind metasurface holography design are discussed later. Next, extended functionalities such as arbitrary polarization holography, vectorial holography, full-color holography, and hybrid holography achieved in the metasurface platform are presented. Surface wave and metagrating holography that bridges the on-chip surface wave and free-space wave is also introduced. In the end, we envisage practical applications of high-fidelity 3D holographic display, high-secure encryption, and high capacity digital encoding and also indicate remaining challenges based on metasurface holography.

The East Asian summer monsoon has complex space and time structures that are distinct from the South Asian summer monsoon. It covers both subtropics and midlatitudes and its rainfall tends to be concentrated in rain belts that stretch for many thousands of kilometers and affect China, Japan, Korea, and the surrounding areas. The circulation of the East Asian winter monsoon encompasses a large meridional domain with cold air outbreaks emanating from the Siberian high and penetrates deeply into the equatorial Maritime Continent region, where the center of maximum rainfall has long been recognized as a major planetary scale heat source that provides a significant amount of energy which drives the global circulation during boreal winter. The East Asian summer monsoon is also closely linked with the West Pacific

summer monsoon. Both are part of the global climate system and are affected by El Niño/Southern Oscillation (ENSO) and surface temperature variations in the western Pacific and surrounding oceans, the tropospheric biennial oscillation, and the South Asian summer monsoon. In addition, typhoons in the western North Pacific are most active during the East Asian summer monsoon. They may be considered as a component of the East Asian summer monsoon as they contribute substantial amounts of rainfall and have major impacts on the region. Because of its impacts on nearly one-third of the world's population and on the global climate system (including effects on climate change), the study of the East Asian monsoon has received increased attention both in East Asian countries and in the United States. The subject of ocean turbulence is in a state of discovery and development with many intellectual challenges. This book describes the principal dynamic processes that control the distribution of turbulence, its dissipation of kinetic energy and its effects on the dispersion of properties such as heat, salinity, and dissolved or suspended matter in the deep ocean, the shallow coastal and the continental shelf seas. It focuses on the measurement of turbulence, and the consequences of turbulent motion in the oceanic boundary layers at the sea surface and near the seabed. Processes are illustrated by examples of laboratory experiments and field observations. The Turbulent Ocean provides an excellent

This textbook compiles reports written by about 35 internationally recognized authorities, and covers a range of interests for geotechnical engineers. Topics include: fundamentals for mechanics of granular materials; continuum theory of granular materials; and discrete element approaches.

"Buddhist monasteries, in both Ancient India and China, have

played a crucial social role, for religious as well as for lay people. They rightfully attract the attention of many scholars, discussing historical backgrounds, institutional networks, or influential matters. Still, some aspects of monastic life have not yet received the attention they deserve. This book therefore aims to study some of the most essential, but often overlooked, issues of Buddhist life: namely, practices and objects of bodily care. For monastic authors, bodily care primarily involves bathing, washing, cleaning, shaving and trimming the nails, activities of everyday life that are performed by lay people and monastics alike. In this sense, they are all highly recognizable and, while structuring monastic life, equally provide a potential bridge between two worlds that are constantly interacting with each other: monastic people and

their lay followers. Bodily practices might be viewed as relatively simple and elementary, but it is exactly through their triviality that they give us a clear insight into the structure and development of Buddhist monasteries. Over time, Buddhist monks and nuns have, through their painstaking effort into regulating bodily care, defined the identity of Buddhist samḡha, overtly displaying it to the laity"--Page 4 of cover.

This book provides an exhaustive view of China's Management Control Systems (MCS), examining the development of theory and practice and presenting a framework that integrates China's unique enterprise regulations, corporate culture and managerial mindset into management control systems. The work offers detail about the effects of China's economic reforms on management control in Chinese enterprises and insightful comparisons with

Western theory and Western examples. Readers will discover important themes and the evolution of theory in MCS, including discussions of frameworks and the links between management control and economics, management, accounting, cybernetics and system theory. Early chapters explore management control in Chinese enterprises during the period, especially the demands of (guidance, enforcement and external regulation) and the demand for (stakeholders, managers, investors) management control. The work moves on to explore Western management control theory and research, including an examination of the evolution of internal control theory. The author presents detailed perspectives on the elements of management control systems and introduces masterful new ideas and methods through four general

control models and ten critical elements in the management control process. A view of management control in various different types of enterprise is presented, from special enterprises and small to medium enterprises to non-profit organizations. The standards for enterprise management control are explored. This work is a valuable practical guide for corporate management teams who wish to develop and execute their own internal control strategies. It will also provide foreign researchers, policy-makers and practitioners with a new perspective on Chinese management control experiences.
