Worldwide, there are approximately 250 species of bumble bees. Over 40 bumble bee species are native to North America. Of these, only one species, *Bombus impatiens*, is currently reared by commercial producers in North America. Bumble bees vary greatly in size, with bees weighing from 40 to 830 milligrams (0.0014 to 0.029 ounces).

**Natural History of Bumble Bees —SARS**  
Bumble bees are social insects, living in colonies consisting of a queen and her offspring. As in most societies, through cooperation and division of labor, the social colony has greater productivity than the sum of each individual's abilities. Tasks are divided among the three types of bees. The queen's prime duty is to lay eggs.

Although some males develop from unfertilized eggs laid by the queen, most hatch from eggs laid by workers. In early fall the queen stops laying eggs, and the colony, including the queen, gradually dies out. During this period the larvae of certain moths and beetles prey on the remaining eggs and larvae in the nest.

The Cuckoo bumblebee lifecycle. Cuckoo bumblebees are a group of related species that are descended from 'true' or 'social' bumblebees. However, cuckoo bumblebees, like their namesake the cuckoo bird, use the nest of true bumblebees to raise their own offspring. The female (there is no queen) cuckoo bumblebee enters the nest of the true bumblebee, and often hides in the nest debris for a while.
